Instructions for precise measuring for Juzo® compression sleeves

Please note:
- The patient's arm and hand must be free of oedema.
- Ideally measurements should be carried out directly after lymph drainage.
- For measuring please use a Juzo® measuring tape and a special pen for the skin.
- At first please mark the measuring points with the special pen on the skin.
- Length measurements have to be taken at the inside of the arm. Please fill the measurements directly in the dotted lines of the size chart.
- Please take all circumferences with a tape measure which is uniformly applied around the arm. The arm should be measured hanging easily, not being stretched.
- “cC” has to be measured distal from the wrist knuckle at the carpus to avoid a slipping back of the compression sleeve.
- For the model “attaching to the bra strap” we recommend a broad strap; please indicate its breadth.
- For the model “with overheight” it is to the shoulder corresponding to the circumference “cG” 3 to 5 cm long.
- Compression sleeves and compression gloves are produced and used separately. Advantages: the putting on of compression sleeve and glove gets easier that way. And beside, increased compression values in the space between the fingers can be avoided. (The overlap area is considered in the knitting process.)
- For the model “with bolero attachment”, two compression sleeves are attached to a bolero back and fastened to it. This does not provide any compression in the shoulder or back areas!

For the ordering of compression gloves please use the separate order form "compression gloves".

Further information can be found in the flyer “Tips for taking accurate measurements for compression sleeves/gloves”.

For the selection of the appropriate garment, we recommend the brochure Juzo® Expert Special-purpose medical garments.
